Activated carbon, also called activated charcoal, is a form of carbon processed to have small, low-volume pores that increase the surface area available for adsorption or chemical reactions.

Activated is sometimes replaced by active.. Due to its high degree of microporosity, one gram of activated carbon has a surface area in excess of 3,000 m<sup>2</sup> (32,000 sq ft) as determined by gas adsorption.

An activated carbon cloth provided by MAST Carbon (C-TEX27 woven) was used as the carbon material for the preparation of the composites. Porous texture of C-TEX27 was characterized by physical adsorption of N<sub>2</sub> (−196 °C) and CO<sub>2</sub> (0 °C), using an automatic adsorption system (Autosorb-6, Quantachrome). The samples were outgassed at 250 °C under vacuum for 4 h.

The first supercapacitors were made in the late 1950s using activated charcoal as the plates. Since then, advances in material science have led to the development of much more effective plates made from such things as carbon nanotubes (tiny carbon rods built using nanotechnology), graphene, aerogel, and barium titanate.
