A few weeks back, my GE Arctica starting showing temps of 12 deg on the freezer side and 42 on the fridge side. Figuring that the defrost element was toast, I ordered this replacement and it showed up the next day. Pulled everything out, removed all the shelves and back plate and easily removed the old element which was definitely fried.

If these solutions don't work, consider whether the machine has had enough time to cool off. If the refrigerator was recently plugged in, if the doors were left open for an excessive period of time, if the temperature controls were recently changed, if the defrost cycle just ran or if a large quantity of food was recently added, the device might just need time to cool off again.

I am having a similar issue for the third time with my GE Profile Arctica. We hired a guy who warmed the inside of the freezer door the first time and that made the water flow again. About 8 months later it stopped again. He came out and warmed the inside again, but wound up doing something inside the front door panel and the water came out again.
